USSR/Satellites

Ultrasonics in Film Manufacture/Infra-Red Film

Apr 53

Apr 53

1

50X1

1. We have heard rumors in the past that ultrasonic agitation has been used in the manufacture of emulsions for film in the USSR or the Satellites. We cannot, at this time, recall the source of the rumors. We have discovered no tangible evidence in the films we have examined from this region which would substantiate or disprove the truth of these rumors. From work carried out on this subject in our own laboratories, we have been unable to detect any measurable difference in the properties of films which could be attributed to ultrasonic agitation.
2. We have no first hand information on infra-red photographic films made in the USSR or Satellites. Our best judgment is that they have nothing equal to infra-Red products on the US market.
